

C PROGRAMING

Ketan Kore

Sunbeam Infotech

Storage class

	Storage	Initial value	Life	Scope
auto / local	Stack	Garbage	Block	Block
register	CPU register	Garbage	Block	Block
static	Data section	Zero	Program	Limited
extern / global	Data section	Zero	Program	Program

- Each running process have following sections:
 - Text
 - Data
 - Heap
 - Stack
- Storage class decides
 - Storage (section)
 - Life (existence)
 - Scope (visibility)
- Accessing variable outside the scope raise compiler error.

Storage class

- Local variables declared inside the function.
 - Created when function is called and destroyed when function is completed.
- Global variables declared outside the function.
 - Available through out the execution of program.
 - Declared using extern keyword, if not declared within scope.
- Static variables are same as global with limited scope.
 - If declared within block, limited to block scope.
 - If declared outside function, limited to file scope.
- Register is similar to local storage class, but stored in CPU register for faster access.
 - register keyword is request to the system, which will be accepted if CPU register is available.

Recursion

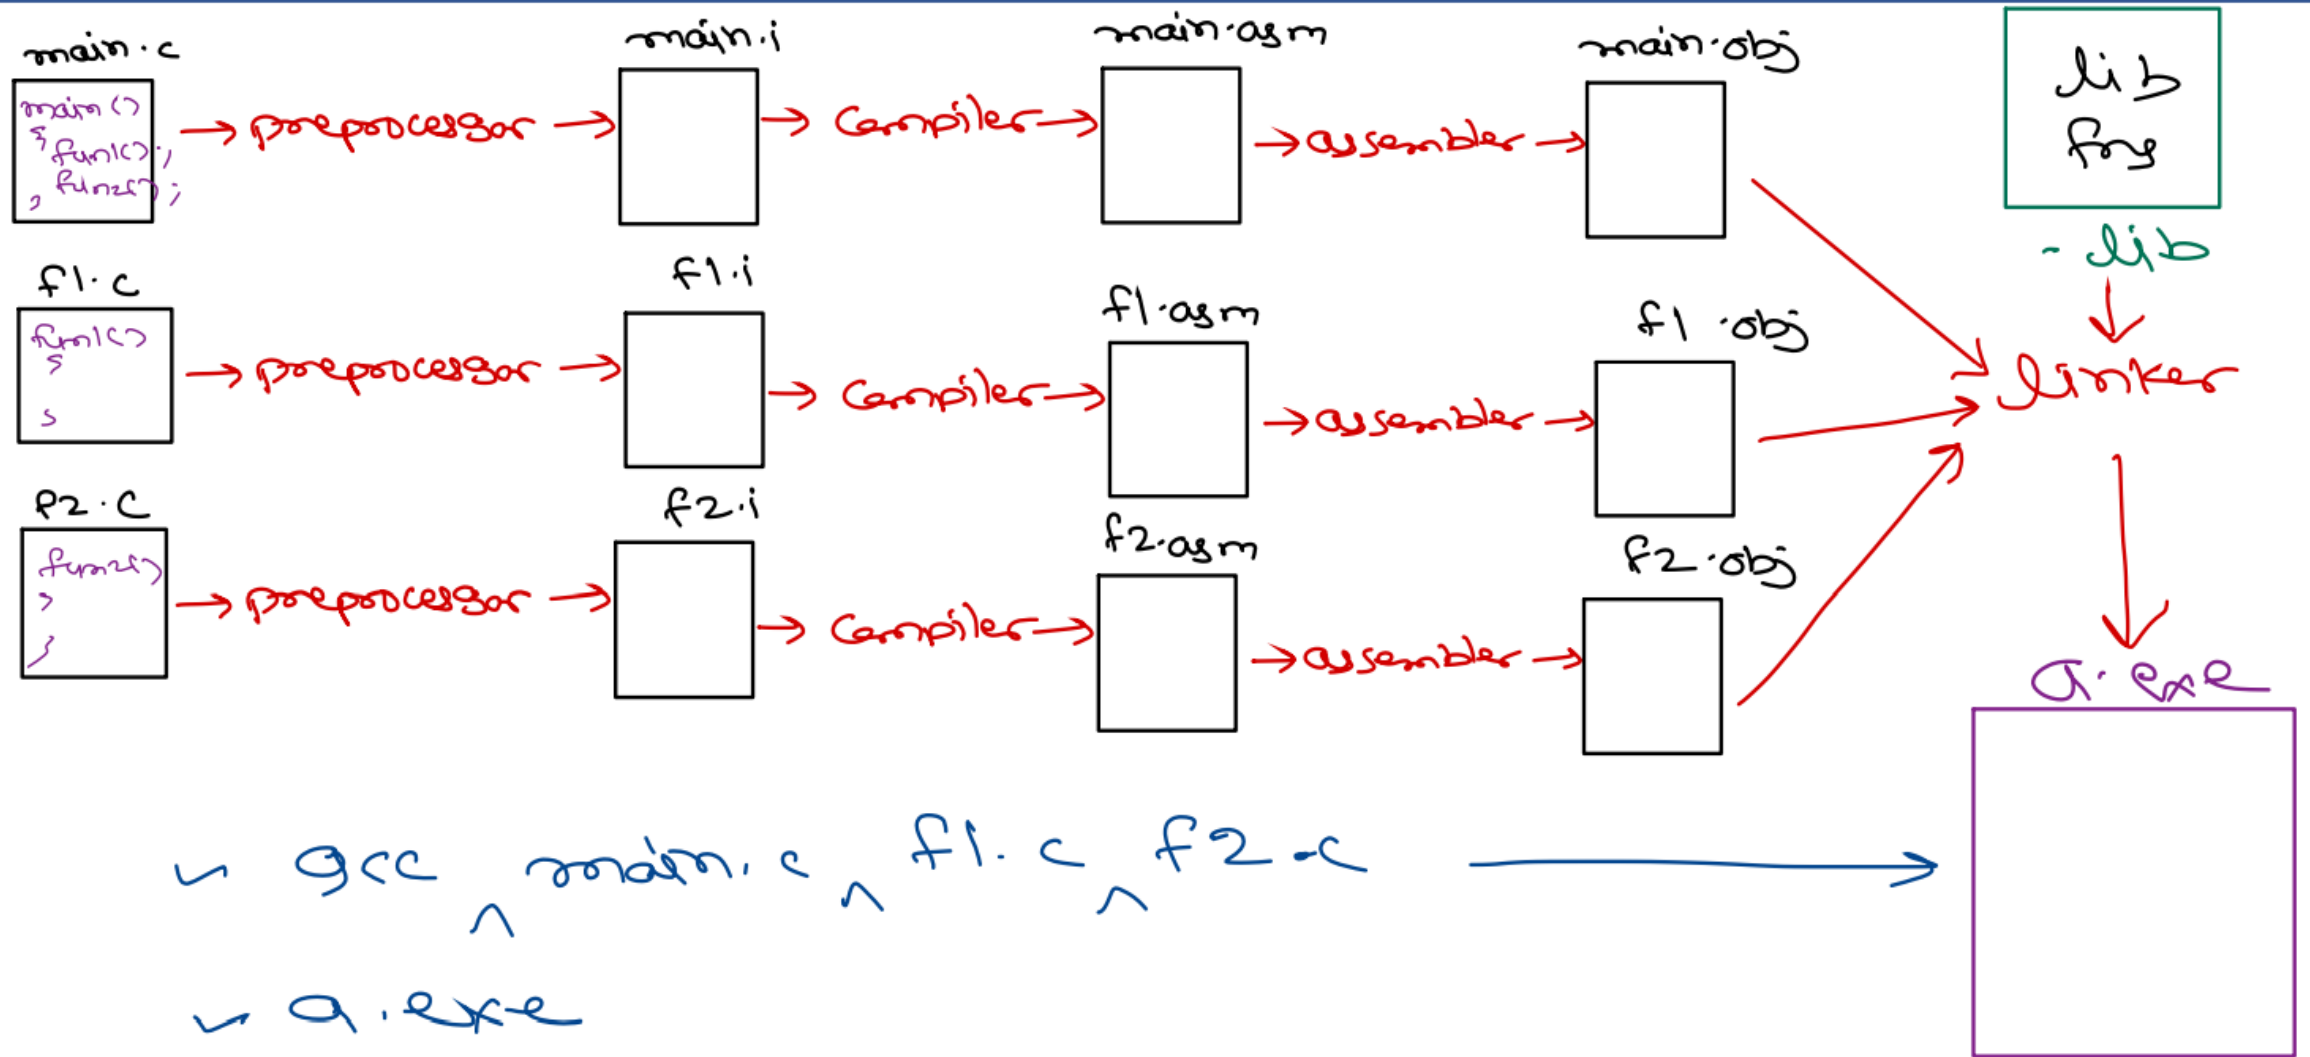

- Function calling itself is called as recursive function.
- To write recursive function consider
 - Explain process/formula in terms of itself
 - Decide the end/terminating condition

- Examples:

- $n! = n * (n-1)!$ $0! = 1$
- $x^y = x * x^{y-1}$ $x^0 = 1$
- $T_n = T_{n-1} + T_{n-2}$ $T_1 = T_2 = 1$
- $\text{factors}(n) = 1^{\text{st}} \text{ prime factor of } n * \text{factors}(n)$

- Advantages
 1. Simplified Readable programs (Divide and conquer Problems)
- Disadvantages
 - Needs More Space (FAR on stack)
 - Needs More Time (FAR Created)

Recursion execution

<pre>int fact(int n) { int r; if(n==0) return 1; r = n * fact(n-1); return r; }</pre>	<pre>int fact(int n) { int r; if(n==0) return 1; r = n * fact(n-1); return r; }</pre>	<pre>int fact(int n) { int r; if(n==0) return 1; r = n * fact(n-1); return r; }</pre>	<pre>int fact(int n) { int r; if(n==0) return 1; r = n * fact(n-1); return r; }</pre>	<pre>int fact(int n) { int r; if(n==0) return 1; r = n * fact(n-1); return r; }</pre>	<pre>int fact(int n) { int r; if(n==0) return 1; r = n * fact(n-1); return r; }</pre>
---	---	---	---	---	---

```
int main() {  
    int res;  
    res = fact(5);  
    printf("%d", res);  
    return 0;  
}
```

$$5! = 5 * 4!$$

$$4! = 4 * 3!$$

$$3! = 3 * 2!$$

$$2! = 2 * 1!$$

$$1! = 1 * 0!$$

$$0! = 1$$

Thank you!
